Connecting People, Locations, Data, Clouds, and Applications to Support Mission Critical Needs

D.R. Carlson
Director of Segment Marketing for the Americas
Equinix

Abstract:
Federal agencies are often tasked with securely connecting one or multiples of five things — people, locations, data, clouds and applications — to support their mission-critical needs. Currently, federal agencies are also facing increasing pressure to future proof and further secure infrastructure. There is a growing federal focus on the physical security of government data centers, and the adoption of hybrid multi-cloud strategies that explore vendor-neutral data center options.

D.R. Carlson can speak to the three areas government agencies must address to effectively meet these demands: digital core, digital ecosystems and digital edge. By leveraging software-defined networking and interconnection capabilities, government agencies can dynamically deliver services from two or more clouds, networks or other digital service providers around the globe — keeping pace with the ever-changing digital world and best enabling warfighter success at the edge.
