Convergence of IT and OT Security

Zach Bennefield

Senior Security Engineer

Tenable

Abstract:

Industrial Control Systems are commonly thought of as major manufacturing plants, but a Naval vessel on the water is a floating factory that carries personnel and equipment to mission critical areas to ensure the success of the Nation's interests. Current vulnerability management efforts have primarily focused on traditional IT devices, but more emphasis needs to be placed on understanding the risk of Industrial Control Systems and how to secure them.

This presentation revolves around the convergence of IT and OT security into one holistic view to enable faster response to vulnerabilities which ultimately reduces risk.
